

Test report — 16 Sep 2026

\$1UPWINS launch kit — PASS (33 of 33)

- Ran `tests/run_tests.py` inside the kit. Full log with asset hashes: `TEST_RESULTS.md` in the zip.
- Checked: `metadata.json` valid and matching the token sheet; name, symbol, chain 8453, 1B supply, 0/0 tax, identity and X handle consistent across `TOKEN.md`, `index.html`, `LAUNCH_POSTS.md` and the PDF; token image square 1500x1500 (591 KB) with a matching transparent PNG; landing-page links resolve; contract shown as PENDING everywhere; no old-mascot or old-spelling text anywhere.
- Negative test: seeding a wrong supply and an old "Taz" line into a scratch copy made the suite fail on exactly those two checks, so it does catch mistakes.
- Official token image SHA-256:
`8b9406c07262d02992b9b408570af1571cd7d008ba186db14e960277bc3ab921`

JOSH23 Hardhat package — static checks PASS, unit tests not run

- `npm run hardhat test` could not run here: this sandbox has no internet, and Hardhat/OpenZeppelin are not installed (npm needs the registry). Your `TEST_RESULTS.md` dated 16 Sep says 5/5 passing; I could not confirm that.
- Verified: JavaScript syntax of `hardhat.config.js`, `scripts/deploy.js` and `test/JOSH23.test.js`; lockfile pins hardhat 2.29.1, @openzeppelin/contracts 5.6.1, hardhat-toolbox 6.1.2, ethers 6.17.0; Solidity pragma `^0.8.28` matches the configured compiler; `JOSH23.sol` has a constructor only (no mint, tax, blacklist or pause), which matches the "no external mint" test; every string the tests expect exists in the contract.
- `scripts/deploy.js` sends the entire 1,000,000,000 JOSH23 supply to `0xba9a68e5a837720af0c7799a7549c3067d7f03e7`. Confirm that is your wallet before you sign anything.
- To run the tests yourself (needs Node 22 and internet): `npm ci` then `npm run hardhat test`. Deploy to testnet with `npm run hardhat run scripts/deploy.js --network baseSepolia` using a `.env` that never leaves your machine.

Not testable here

Base Sepolia deployment, Basescan verification and launcher upload all need your wallet.
